

Migrant Hub

Everything you need to start
your life in Finland

SPRINT 3 REVIEW

Pratham Arora · Prabhleen Kaur · Sajib Das
Sehwinder Singh · Yun Wang

Where we started

09

Figma wireframes

- Home, search, blog, post detail, writing, Must Do, DVV detail and community.
- Every screen was a picture.
- AI and search were concept only.

Sprint 3 is where those pictures became a working site.

Home page

SPRINT 1 / PROTOTYPE

SPRINT 3 / LIVE DATA

The three posts on the home page are now fetched from GET /posts, not drawn by hand. The category chips and the search box both run real queries.

Blog

SPRINT 1 / PROTOTYPE

SPRINT 3 / LIVE DATA

Every card is a document in MongoDB. The author name comes from the account that wrote the post, so it cannot be faked by the browser.

Write your post here...

The prototype said "Publish - concept only, not implemented in Sprint 1". It now publishes, and only a logged in user can reach the page at all.

Must Do checklist

SPRINT 1 / PROTOTYPE

SPRINT 3 / LIVE DATA

Six steps served from GET /mustdo. We wrote every word by hand rather than generating it, because this is official advice about DVV, the police and the bank.

Must Do detail

SPRINT 1 / PROTOTYPE

SPRINT 3 / LIVE DATA

Each step stores the official link and the date the information was checked, so a newcomer can see how fresh it is and go to the real source.

Community

SPRINT 1 / PROTOTYPE

SPRINT 3 / LIVE DATA

The community feed was concept only in Sprint 1. A post can now be filed under a community when it is written, and the feed reads it back.

From promise to AI assistance

- Google Gemini reads the draft and suggests a category, tags and a short summary.
- The writer decides: every suggestion stays editable.
- The API key stays on our server.
- Responses are checked: one of seven categories, at most five tags.

The screenshot shows a web form titled "Write a post" with the subtitle "Share your experience, advice, or useful information with the Migrant Hub community." The form has two main input areas: "Title" with a placeholder "Enter your post title" and "Post" with a placeholder "Write your post here...". Below the "Post" area, it says "512 words remaining". At the bottom, there is a section titled "Need a hand?" with the text "Migrant Hub can read your draft and suggest a category, a few tags and a short summary. Everything stays editable." and a button labeled "Suggest category, tags & summary".

Designed to fail safely

If Gemini is busy or does not answer, the page says so and the post still publishes. Publishing never depends on AI.

Under the hood

01

Accounts

- Register and log in; passwords hashed with bcrypt.
- JWT on every protected request.
- Wrong passwords and unknown emails return the same message.

02

Your post is yours

- The token defines the author, not the request.
- Only allowed fields are saved.

43

Tested

- Automated tests with Vitest and Supertest.
- A separate test database keeps demo data safe.
- Every API endpoint is documented.

How we worked this sprint

01

Sprint Planning

- We planned from our Sprint 2 velocity: 25 of 26 tasks finished
- Day one was one job for all five of us: get one real request working end to end
- We named what we would drop first if we ran short of time

02

Daily Scrums

- Short daily check in, written down with the date
- Blockers named early, so nobody sat stuck

03

Sprint Review

- We demo the running site, not slides of it
- Every member presents the part they built
- Feedback goes straight into the backlog

Retrospective: the four Ls

Liked

- An early API contract aligned the team.
- Everyone knew their own part.
- Publishing works even when AI does not.

Learned

- Testing APIs with Vitest and Supertest.
- How login and tokens work end to end.

Lacked

- Unclear file ownership caused conflicts.
- Some things took longer time then expected, pushing things to very end.

Longed for

- Earlier frontend -backend integration.
- Time to put the site online.

Who built what

Prabhleen Kaur

FRONTEND / DATA LAYER AND AUTH STATE

Shared API hook, environment base URL, authentication context, tokens, protected routes and sign-in-aware navigation.

Pratham Arora

FRONTEND / PUBLISHING / PRODUCT OWNER

Live blog and post detail, loading and errors, publishing, editable AI suggestions, category filtering and search.

Sajib Das

FRONTEND / MUST DO, COMMUNITY, FORMS

Must Do pages, community, login and registration errors, responsive and accessible layouts, and the daily log.

Yun Wang

BACKEND / API, INTEGRATION, DOCUMENTATION

CORS, auth endpoints, protected routes, consistent API errors and endpoint documentation.

Sehwinder Singh

BACKEND / AUTH DATA AND THE AI FEATURE

User model and bcrypt, JWT issuance and verification, auth middleware, post ownership, AI failure handling and tests.

All five of us: the day one integration spike, the API contract, the daily scrums, the review and the retrospective. And whenever one of us was stuck, somebody else stopped and helped.

What was hard. What comes next.

What was hard

- Five people editing one React app caused merge conflicts.
- Field names differed until we agreed on the API contract.
- An often-busy AI service required safe failure handling.
- Visual consistency took longer than building the pages.

What comes next

- Moderation tools, so a community can remove a harmful post
- Finnish and Swedish translations of the Must Do checklist is required.

Thank you - questions welcome
